

# HDD Opportunities & Challenges, Now to 2020

---

Dave Anderson

May, 2013

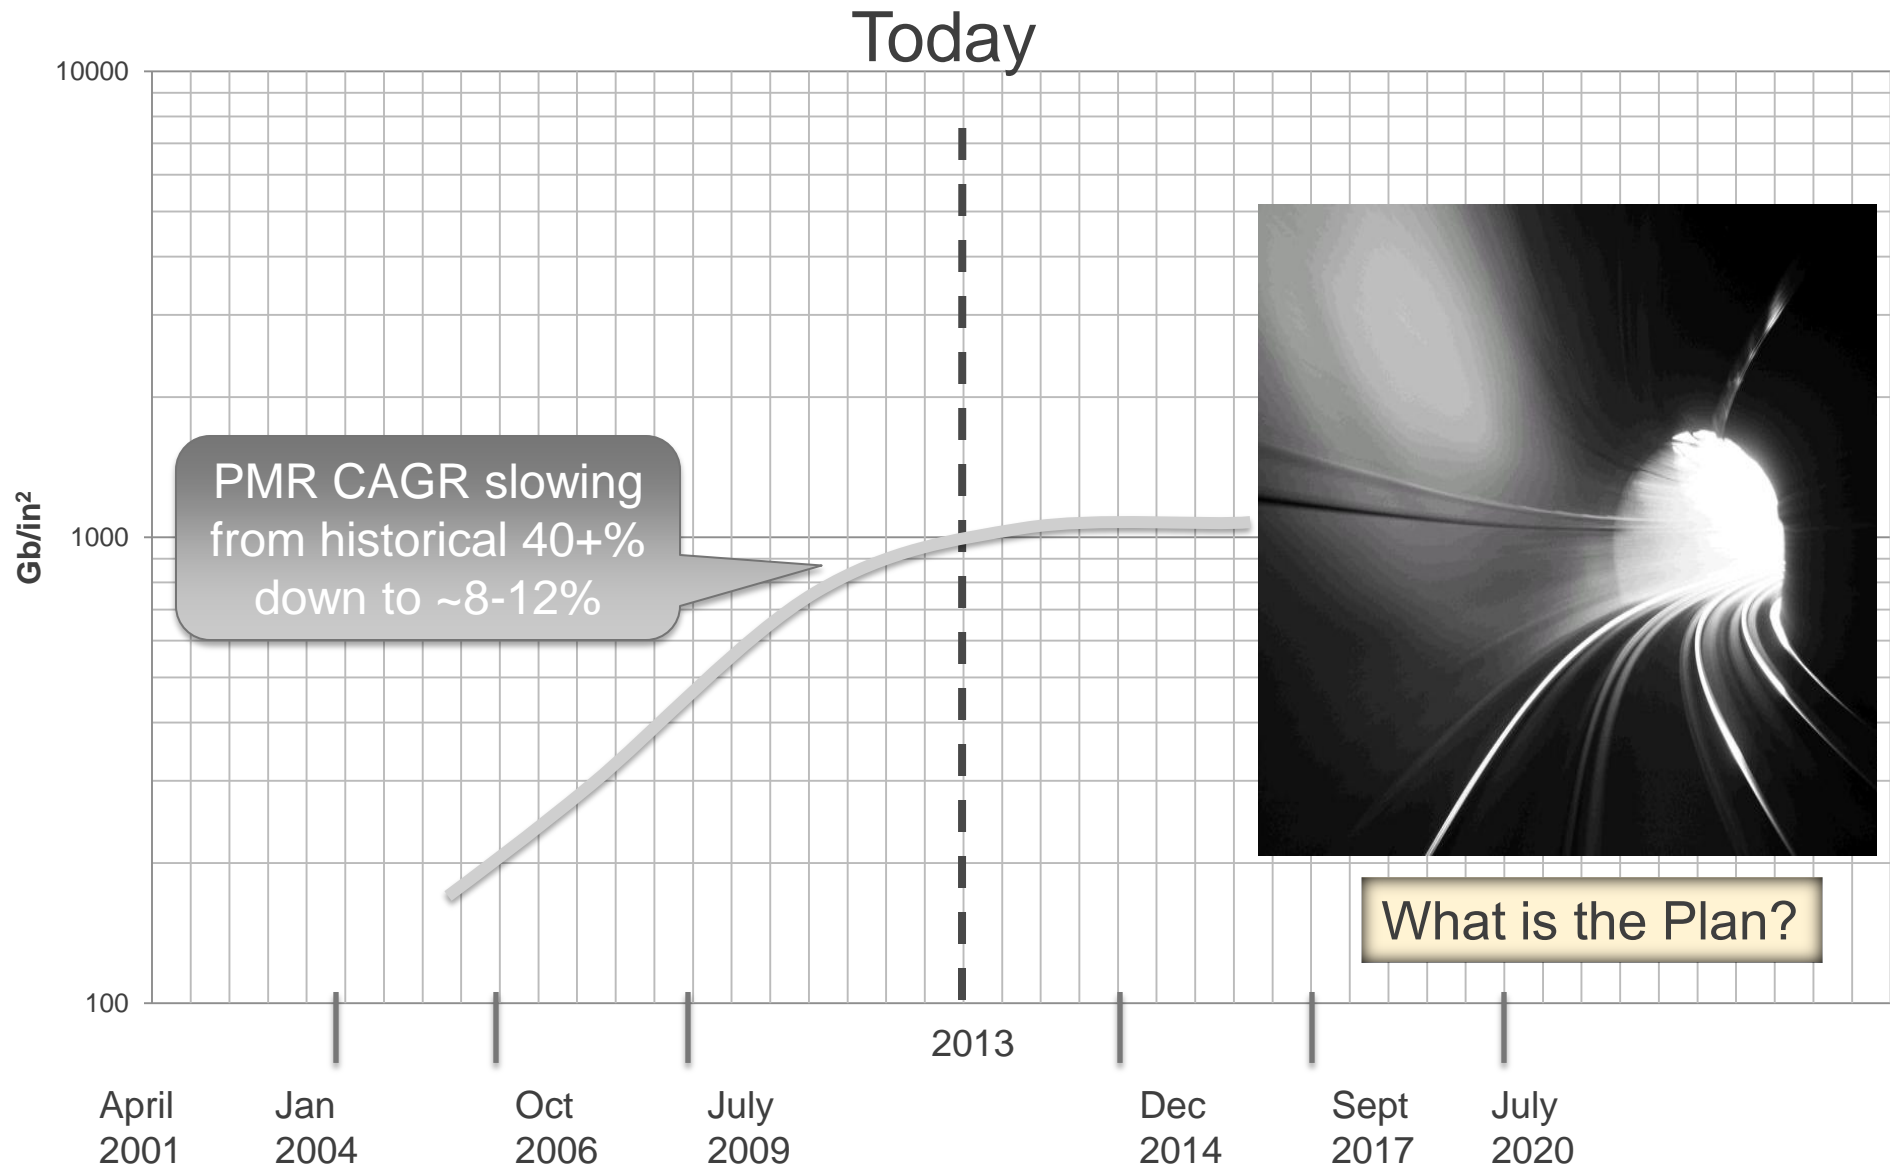

# Areal Density Growth

- Areal Density CAGR 40%
- Transfer Rate CAGR 20%

- Late 1990s – super paramagnetic limit demonstrated through modeling
- Perpendicular expected to extend to 0.5-1 Tb/in<sup>2</sup>
- Additional innovations required at that point
  - heat-assisted recording
  - bit patterned media recording

# Areal Density Trends

Exabyte Growth Over the Last 5 Years

Averaged **40%** per Year

While Areal Density Is  
Growing at only **<10%** per Year

# Particle Trends

## A Recording Head under SEM

Media magnetic grain is ~9-10 nm diameter

Today's data bit is ~ 25 nm wide.

Critical magnetic and contamination features are nm scale.

100 Gb/in<sup>2</sup> — 0.20 x 0.032 μm, 130 ktpi x 800 kbp

1 Tb/in<sup>2</sup> = 50 nm x 12.7 nm, 500 ktpi x 2,000 kbp

2 Tb/in<sup>2</sup> ■ 38 nm x 8.5 nm, 660 ktpi x 3,000 kbp

# Recording Bit Scaling

Areal Density  $\equiv$  TPI \* BPI (Tracks Per Inch X Bits Per Inch)

1 Tb/in<sup>2</sup>

2,000 kbps x 500 ktpi

D = 8.2 +/- 1.3 nm

850 Gbps

2202KBPI x 380KTPI ~1.4x8 grains

500 Gbps

1700KBPI x 300KTPI ~1.6x11 grains

350 Gbps

1450KBPI x 240KTPI ~2.1x13 grains

250 Gbps

1359KBPI x 190KTPI ~2.3x16 grains

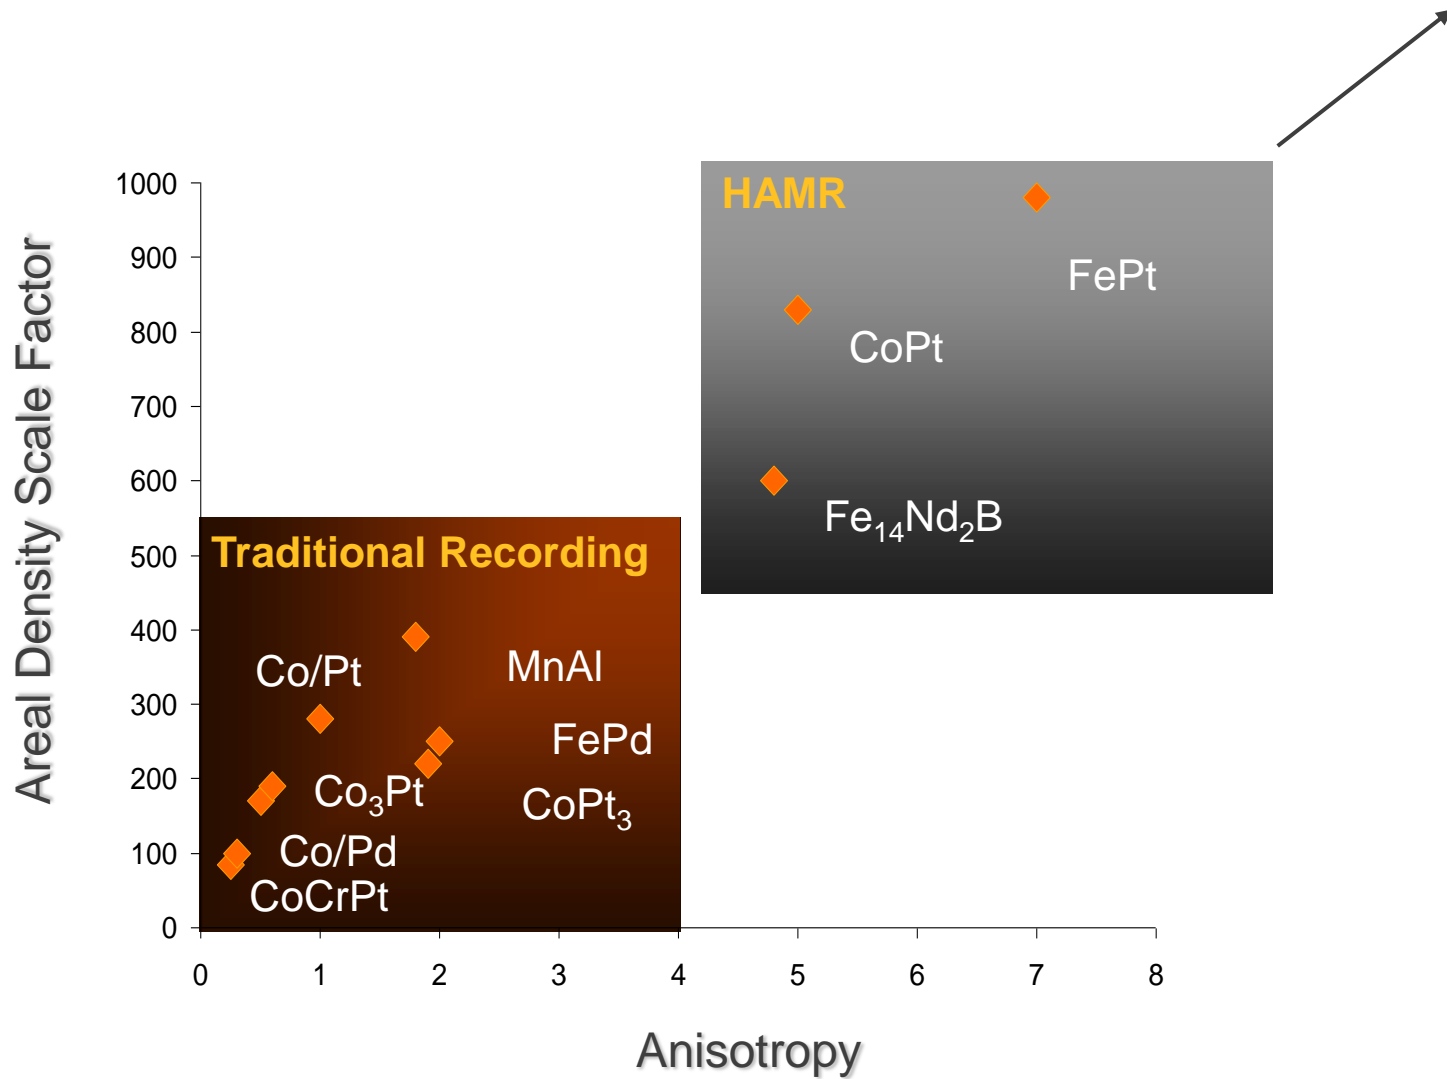

100 Gbps

907KBPI x 151KTPI ~3.4x21 grains

20 nm

Decreasing Bit Size  $\rightarrow$  Increase Areal Density

# Materials for Higher AD

# Heat Assisted Magnetic Recording (HAMR)

Perpendicular Recording

HAMR

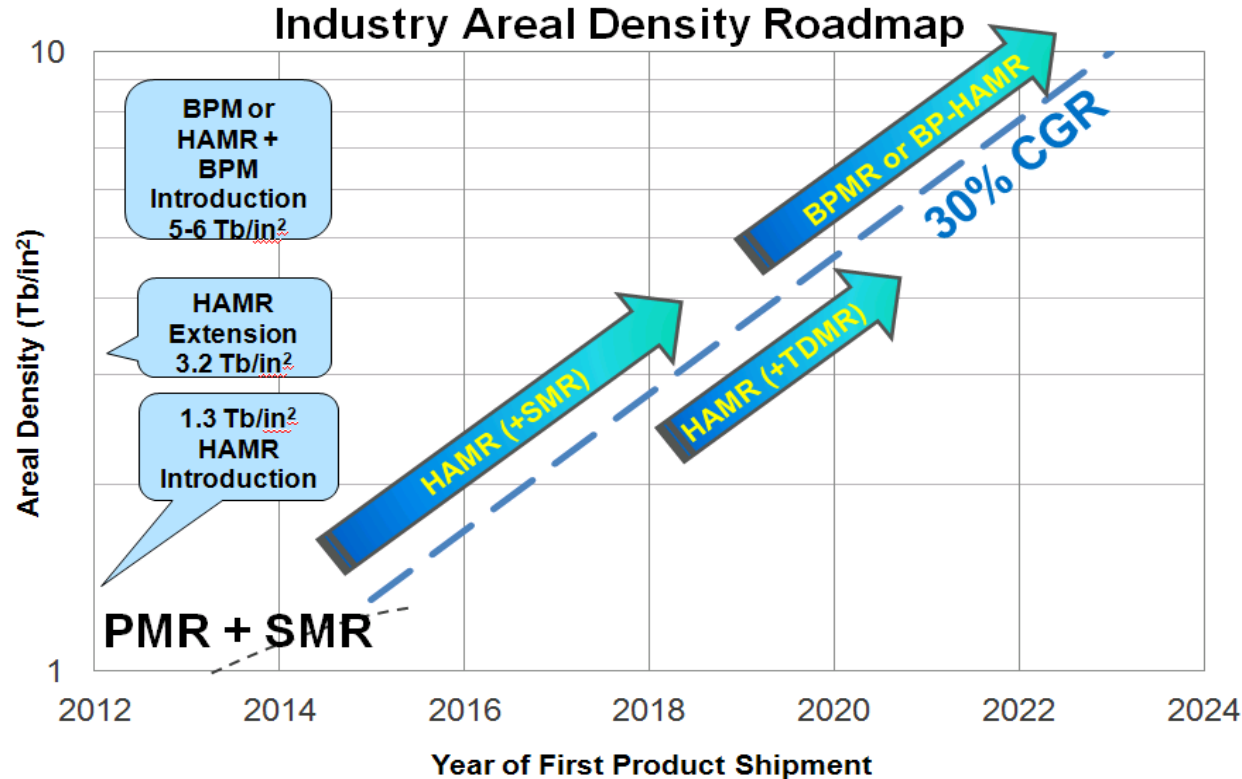

# Heat Assisted Magnetic Recording (HAMR) Technology

- HAMR takes advantage of magnetic media materials with higher thermal stability to push out the onset of the superparamagnetic effect limiting Perpendicular Magnetic Recording (PMR) technology used in current hard disk drives.
- These magnetic materials with higher thermal stability are heated with a tiny laser spot for just long enough to write the magnetic data bits, allowing smaller bit sizes and therefore higher areal densities and capacities than conventional PMR technology.
- A laser is integrated into the HAMR recording head.
- Seagate demonstrated HAMR areal density of 1 Tbit/in<sup>2</sup> in March 2012.
- Seagate CEO Steve Luczo gave a presentation to Wall Street analysts using a fully functional HAMR drive on Sept. 21, 2012.
- PMR technology is likely limited to ~1 Tbit/in<sup>2</sup>, HAMR is thought to push that limit to ~5 Tbit/in<sup>2</sup>
- Market introduction of drives using HAMR technology is currently envisioned for 2015/2016.

Functioning Drive

# ASTC Technology Roadmap

Seagate Confidential

4

**IDEMA**<sup>®</sup>  
The International Disk Drive Equipment and Materials Association

## Technology Alignment:

1. Industry (ASTC) and Seagate staged for HAMR Technology
2. Bit Patterned Media (BPM) post HAMR introduction

# Head/Media Technology Focus

## Component Technology Strategies:

1. PMR Extension & Shingled Magnetic Recording (SMR)
  - 2015-2016 Product Introduction
  - 20-40% CAGR
2. HAMR/Extension
3. BPM+HAMR

# Conclusion

- Worldwide need for storage continues to grow and there is no viable alternative to HDDs in sight to meet this demand
- To address the slowing areal density growth, HDD technology roadmap and component strategy includes:
  - Extending Head/Media perpendicular recording technologies
  - Productizing shingled magnetic recording (includes new Writer Design & Media optimizations)
  - Introduce HAMR technology (integrated laser on head heats media)
