

The following is intended to outline our general product direction. It is intended for information purposes only, and may not be incorporated into any contract. It is not a commitment to deliver any material, code, or functionality, and should not be relied upon in making purchasing decisions. The development, release, and timing of any features or functionality described for Oracle's products remain at the sole discretion of Oracle.

**ORACLE®**

## **Advanced Tape Technologies for Future Archive Storage Systems**

MSST - Media II (Tape Media and Libraries) - Wednesday May 8<sup>th</sup>, 2013

Dr. Mark L Watson with due acknowledgements to Dr. Robert M Raymond  
Oracle Corporation

# Program **Agenda**

- Storage Growth / Requirements / Device Trends
- Recent Disk Trends
- Tape Storage Developments

# Customer Challenge: “Big Data” is Exploding!!!

50%/yr Growth Rate

2009  
Digital Data

0.8  
Zettabytes

2010  
Digital Data

1.2  
Zettabytes

2020  
Digital Data

35  
Zettabytes  
(44x growth)

- IT budgets and headcounts can't keep up
  - Budget are projected to grow 2-3%/yr\*
- Disk prices are not declining at this rate
- **Customers can't afford to just “put everything on disk”**

ORACLE

# Storage Technologies: economics!

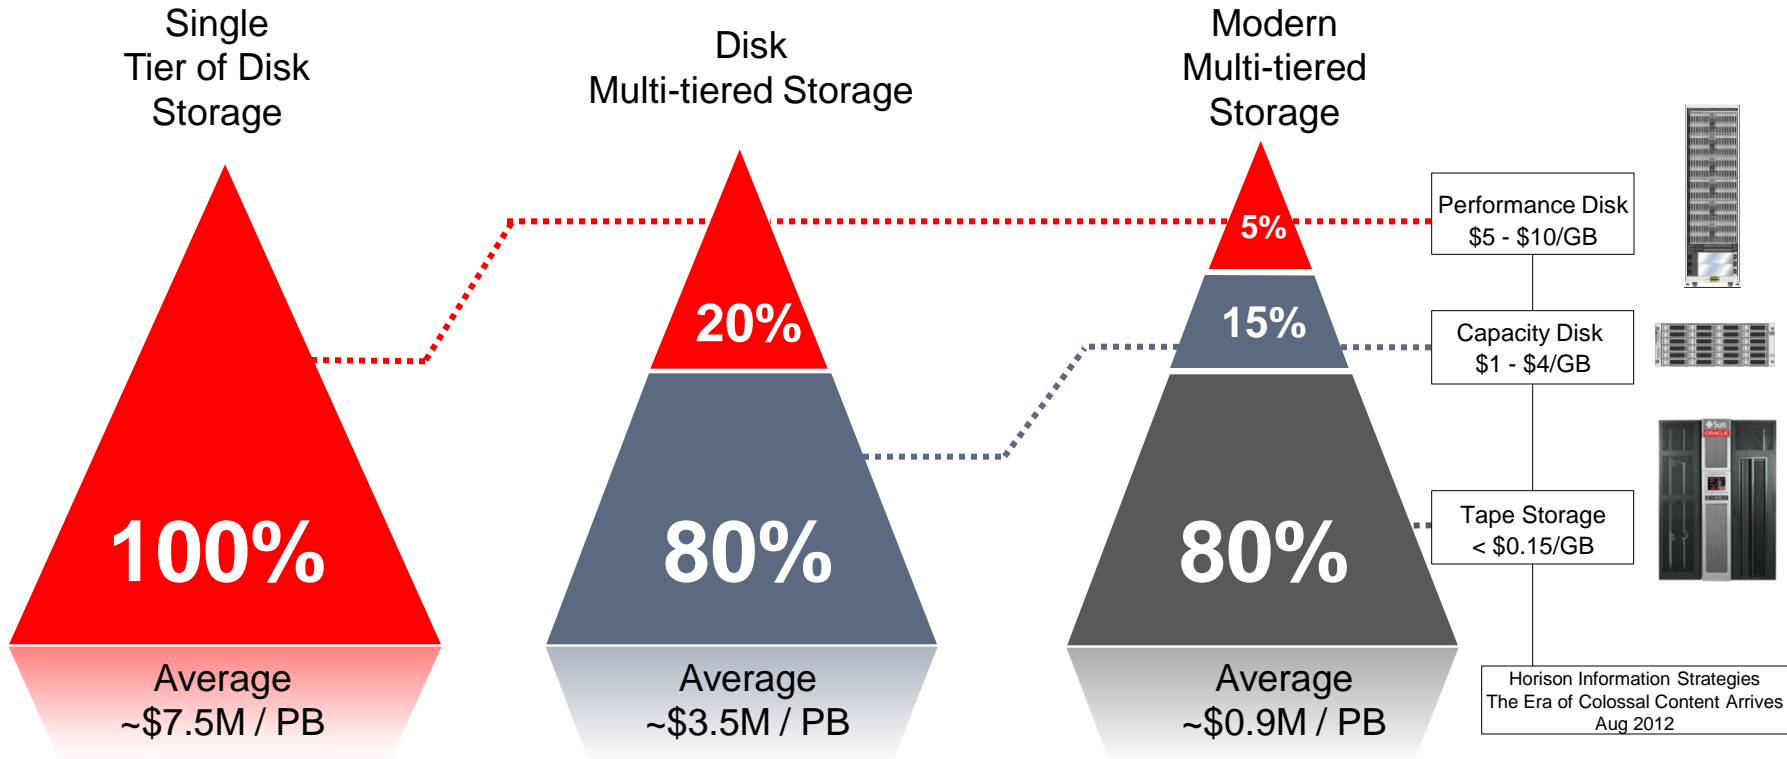

- Assuming a 10 TB HDD is available Storing 25% of the data created in 2016 on HDD would need:
  - **250 million hard drives**
- Idling at 1 watt over 5 years these would consume
  - **39 Peta-Joules of energy**
- Causing the emission of
  - **8 million tons of CO<sub>2</sub>**

ORACLE

# Economics of Tiered Storage

Tape is the Foundation: Most of the Data Stored at the Lowest Cost

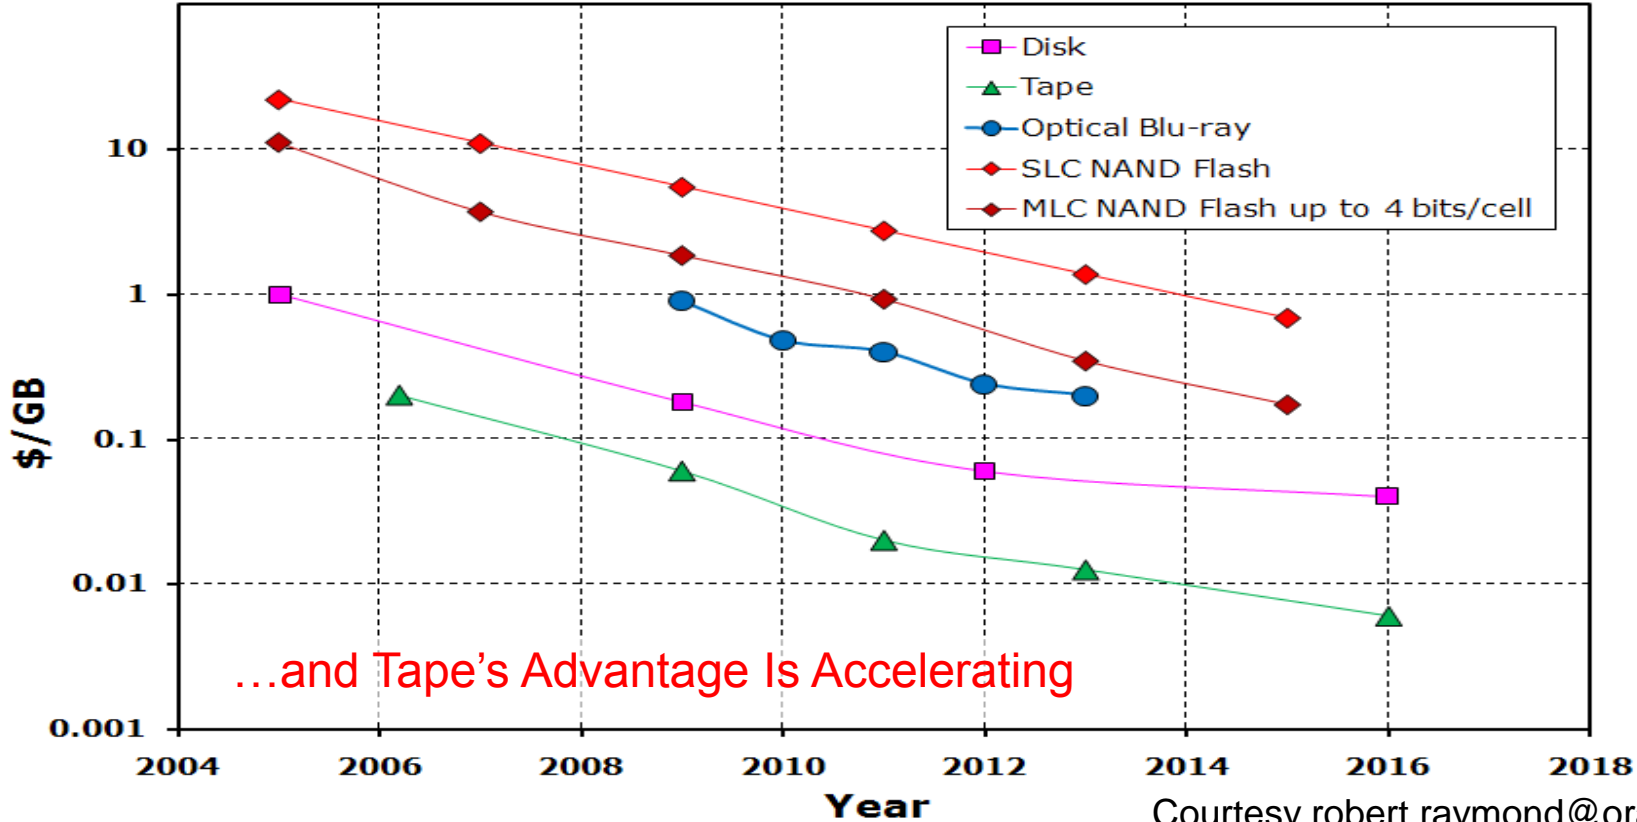

# Storage Technologies Areal Density Trends

Source: disk areal density growth: <http://www.forbes.com/sites/tomcoughlin/2012/10/03/have-hard-disk-drives-peaked/>

Tape gets its capacity by having 1000X the recording surface area comparing a 1/2 inch cartridge to a 3 1/2 inch disk.

ORACLE

# Magnetic Recording Definitions

Track Pitch =  
Track Width +  
distance between  
neighboring tracks

Tracks per inch (tpi) = (Track Pitch)<sup>-1</sup>

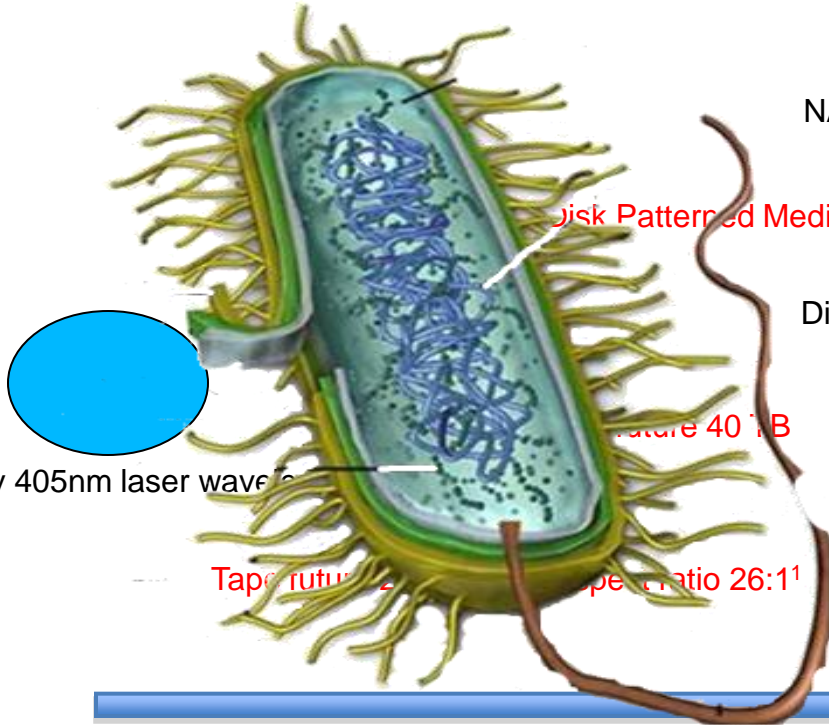

Bits per inch (bpi) = (Bit Length)<sup>-1</sup>

Areal density = (Tracks per inch) X (Bits per inch)

Bit aspect ratio (BAR) = (Track width) / (Bit length):1

# Data Bit Size Comparison

Bacterium  
(2  $\mu\text{m}$ )

Blu-ray 405nm laser wavelength

Tape future 2000

NAND 250 Gb/inch<sup>2</sup> 50nm X 50nm

Disk Patterned Media future 1Tb/inch<sup>2</sup> Bit aspect ratio 1:1

Disk 500Gb/inch<sup>2</sup> Bit aspect ratio 5:1

Tape future 40TB Bit aspect ratio 15:1<sup>1</sup>

Tape future 2000 Bit aspect ratio 26:1<sup>1</sup>

T10KC 5.0 TB  
Bit aspect ratio 46:1

↑  
Bit length direction

← Track width direction

# Tape Bit Size Roadmap

1. Extrapolated from INSIC roadmap

# Recent Disk Trends

# Disk Magnetic Recording Tri-Lemma

- Smaller bits => Smaller grains for required SNR
- Smaller grains => Higher  $H_c^1$  for thermal stability
- Higher  $H_c$  => Can not write on the media

1.  $H_c$  is the media Coercivity, which is the strength of the magnetic field required to flip the magnetization in the media

# Problem: The Super-Paramagnetic Effect

- In order to maintain the necessary signal to noise ratio, smaller bits require smaller grains
- Small grains are easier to de-magnetize

- Can result in loss of information
- Overcoming this requires
- Higher anisotropy recording materials
- Which need new methods of writing data

Over time

# Possible New Disk Technologies

- Areal Density Options<sup>1</sup>
  - Discrete Track Recording (DTR) (~2 Tb/inch<sup>2</sup>)
  - Shingled Recording (SWR) (~5 Tb/inch<sup>2</sup>)
  - Heat Assisted Magnetic Recording (HAMR) (~5 Tb/inch<sup>2</sup>)
  - Microwave Assisted Magnetic Recording (MAMR) (~5 Tb/inch<sup>2</sup>)
  - Bit Patterned Media (BPMR) (~5 Tb/inch<sup>2</sup>)
  - 2-D Recording (TDMR)
- Capacity Options<sup>2</sup>
  - Helium drive: more platters, 23% less power, 40% more capacity

2 [http://www.pcworld.com/article/262274/helium\\_filled\\_wd\\_drives\\_promise\\_huge\\_boost\\_in\\_capacity.html](http://www.pcworld.com/article/262274/helium_filled_wd_drives_promise_huge_boost_in_capacity.html)

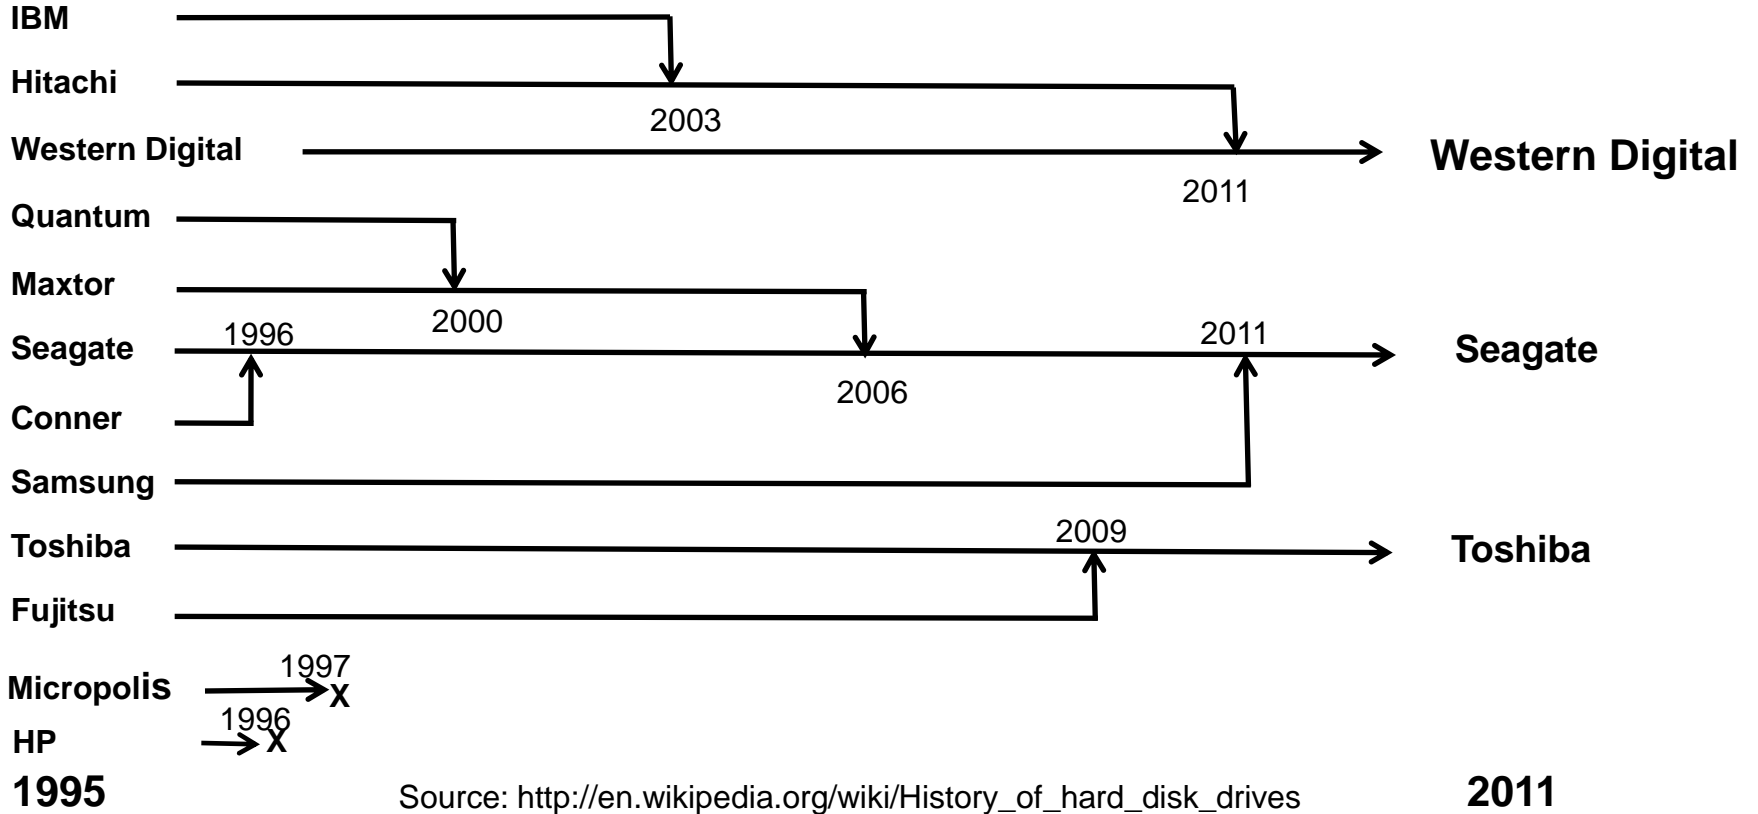

# Disk Observations

- Toshiba areal density (2 1/2): 744 Gb/inch<sup>2</sup> <sup>(1)</sup> or 500GB per platter
- Seagate areal density (3 1/2): 625 Gb/inch<sup>2</sup> <sup>(2)</sup> or 1TB per platter
  - New disk technology areal density demo by Seagate<sup>(3)</sup>
  - HAMR with granular media: >1 Tb/inch<sup>2</sup>
- New disk technology demo by IMRE (Institute of Materials Research and Engineering)<sup>(4,5)</sup>
  - BPM process only not a recording demo ~ 3.3 Tb/inch<sup>2</sup>
- New disk technology areal density demo by Toshiba<sup>(6)</sup>
  - TDK realized an areal density of 1.5 Tbits/(inch)<sup>2</sup> with a magnetic head technology that is based on a thermal assist recording method and uses near-field light. The bit error rate (BER) is 10<sup>-2</sup>.
- More and more consolidation

# Disk Drive Manufacturers Family Tree

Source: [http://en.wikipedia.org/wiki/History\\_of\\_hard\\_disk\\_drives](http://en.wikipedia.org/wiki/History_of_hard_disk_drives)

2011

# Tape Storage Developments

# Technology Marches Forward

## 10 TB Example Over 15 Years

1996

- 6000 carts
- Timberline 9490 – 1.6 GB
- 357 sq ft
- 8200 lbs

It is good to upgrade technology!

2011

- 2 carts
- T10000C – 5.0 TB
- 0.3 sq ft
- 1.2 lbs

# Large Libraries Provide Ideal Data Archiving Solutions

- The hardware costs are amortized over many tape cartridges providing the lowest TCO for large data storage archive repositories.
  - 15X less TCO and 238X less energy over 12 years than disk<sup>1</sup>

Pictured: Ten string StorageTek SL8500 tape library, capable of holding 100,000 media cartridges

1. "In Search of the Long-Term Archiving Solution —Tape Delivers Significant TCO Advantage over Disk", Clipper Notes, December 23 2010, Report #TCG2010054LO

# It's Not Only About Cost/TB

	Disk	Tape
Max shelf life (bit rot)	10 years	30 years
Best practices for data migration to new technology	3-5 years	8-12 years
Uncorrected Bit Error Rate, Probability (avg 1 error in x TB)	$10^{-14}$ ( ~10's of TB)	$10^{-19}$ (~1 million TB)
Power and cooling	238X	X

Each technology refresh or migration has a cost associated with it

# Components of a Tape Drive

Recording heads

Take-up reel

Loader — The motor to engage the cartridge is beneath the loader

Tape cartridge

Red line shows tape

# New Tape Technology Areas

- New Media (BaFe)
  - More stable than ever before
    - Magnetic (thermal), chemical, dimensional
  - Smaller particles or grains
  - Lower noise media structures
- New Recording Channels
  - New LDPC and other codes
- New Heads
  - MR (magneto resistive) >>>> GMR (giant magneto resistive)
  - 32 channels
  - Read older tapes back at least 2 drive generations
- Improved tape path / guiding

# Media details – The Latest Technology

Top layer is magnetic layer (< 100 nm)  
Bottom layer is non-magnetic iron-oxide layer

Magnetic layer  
(MP or BaFe)

Underlayer  
(non-magnetic)

Basefilm/Substrate  
(PEN, PET, or Aramid)

Backcoat

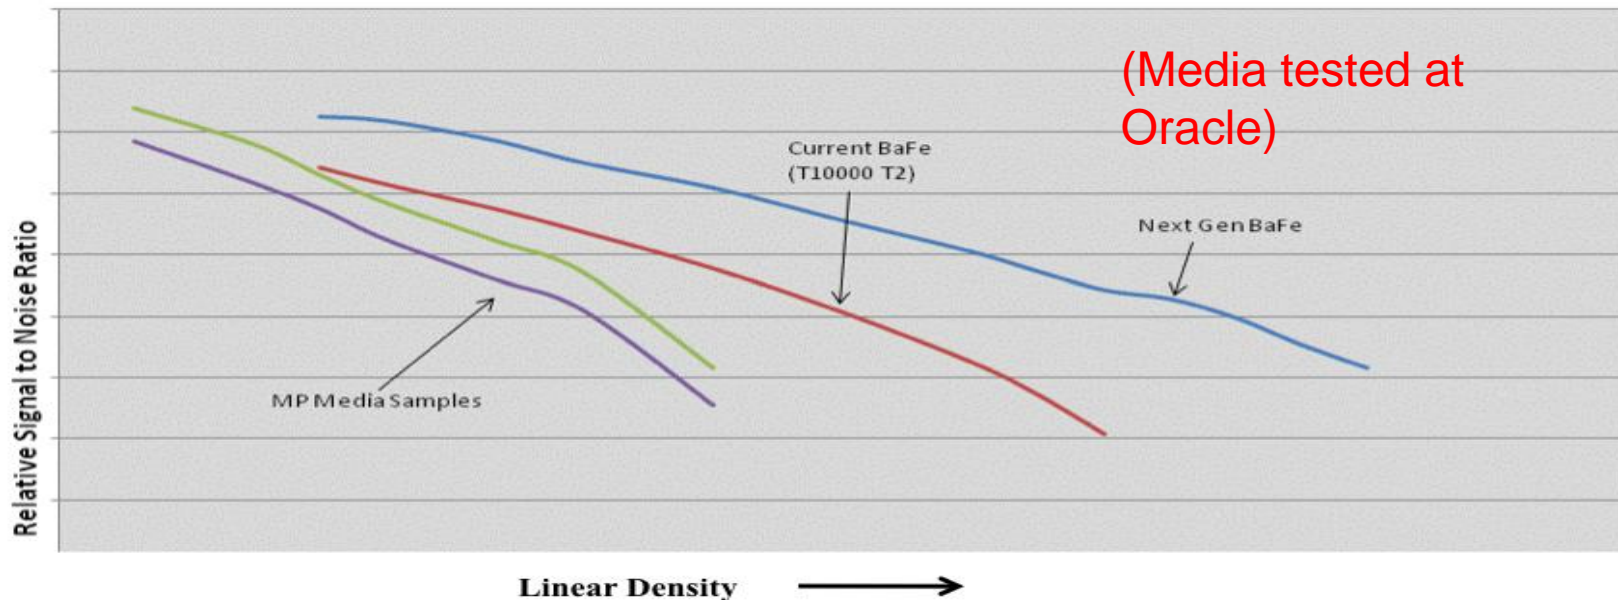

- Barium Ferrite ( $\text{BaFe}_{12}\text{O}_{19}$ )
- Hexagonal, platelet
- Naturally stable oxide
  - No corrosion
  - Chemically un-reactive

Dispersion of BaFe (TEM images)

# The Future of Tape Media

- Further improvements in recording properties of barium ferrite particles / media are possible
- Challenge will be developing drive technology to exploit this media development > new heads, guiding, R/W channels, servo positioning

# Magnetic Degradation

## Measuring Changes in Demagnetization

<http://www.fujifilm.com/news/n100910.html>

- 60C/90% RH for 30 days (equivalent to 30 years ambient storage)
- No change in BaFe magnetic properties
- BaFe ( $\text{BaFe}_{12}\text{O}_{19}$ ) already is fully oxidized
  - Non-reactive
  - Extremely stable
- No impact to read or write performance for BaFe or MP

# Thermal Stability of Magnetic Particles

## No super-paramagnetic issues with tape!

Neel-Arrhenius law gives: Mean time to randomly flip the magnetization of a grain due to thermal fluctuations

$$\tau_N = \tau_0 \exp \left( \frac{KV}{k_B T} \right)$$

V is the volume of the grain, T is the temperature and K is the grain's magnetic anisotropy energy

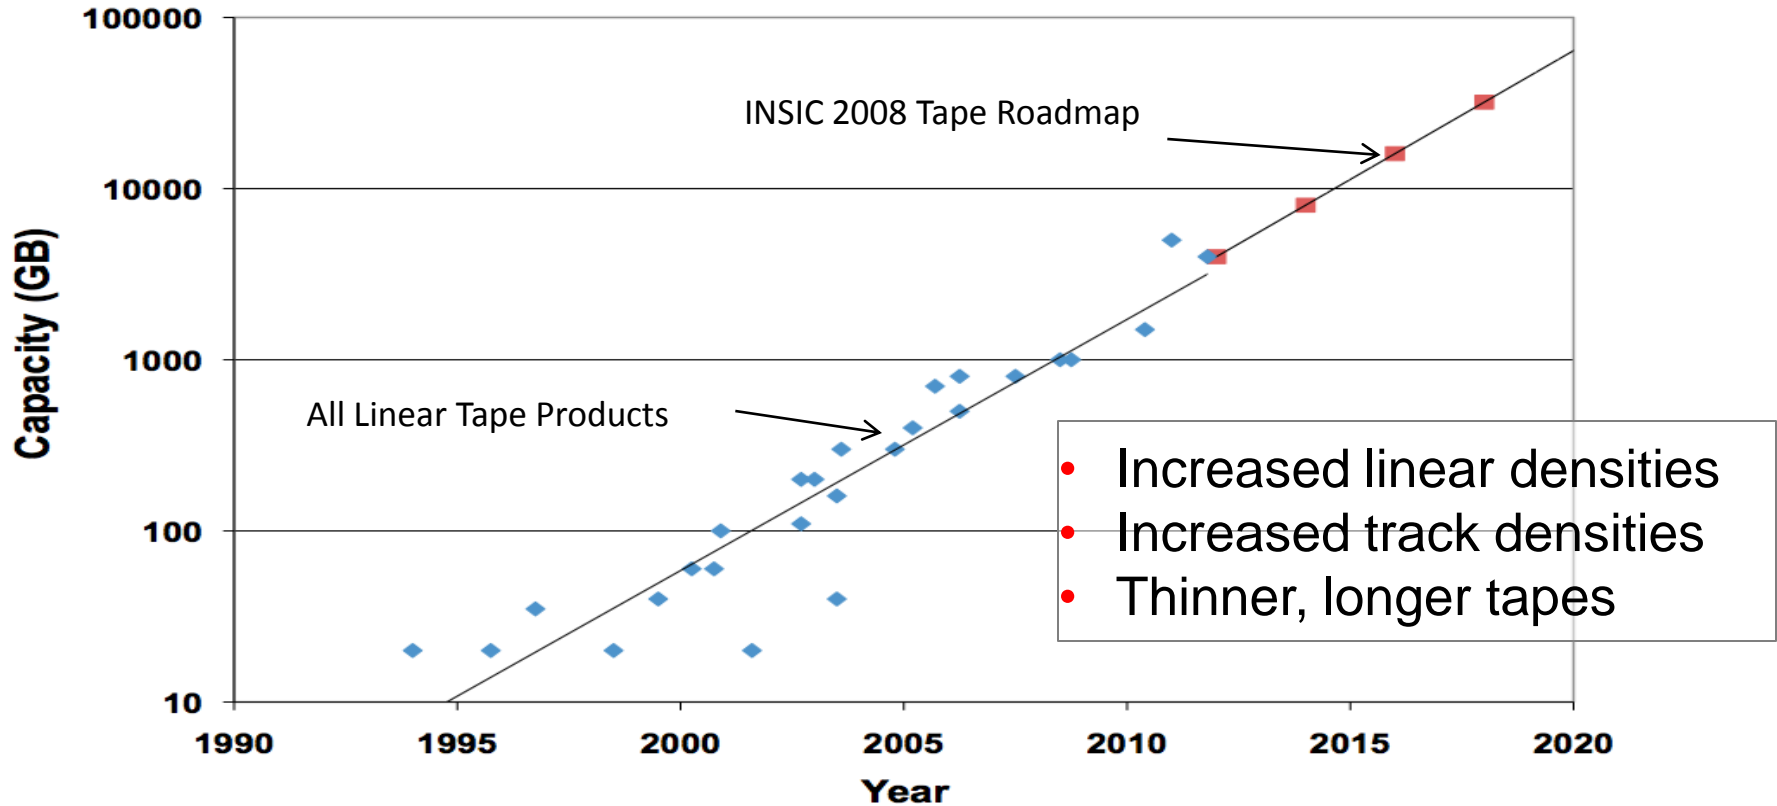

$$\frac{KV}{k_B T} > 90 \text{ for today's tape}^1 \equiv \text{Over a 30 year life!}$$

1. Watson et al. Investigation of Thermal Demagnetization Effects in Data Recorded on Advanced Barium Ferrite Recording Media, IEEE Transactions on Magnetics, Vol. 44, No. 11, November. 2008

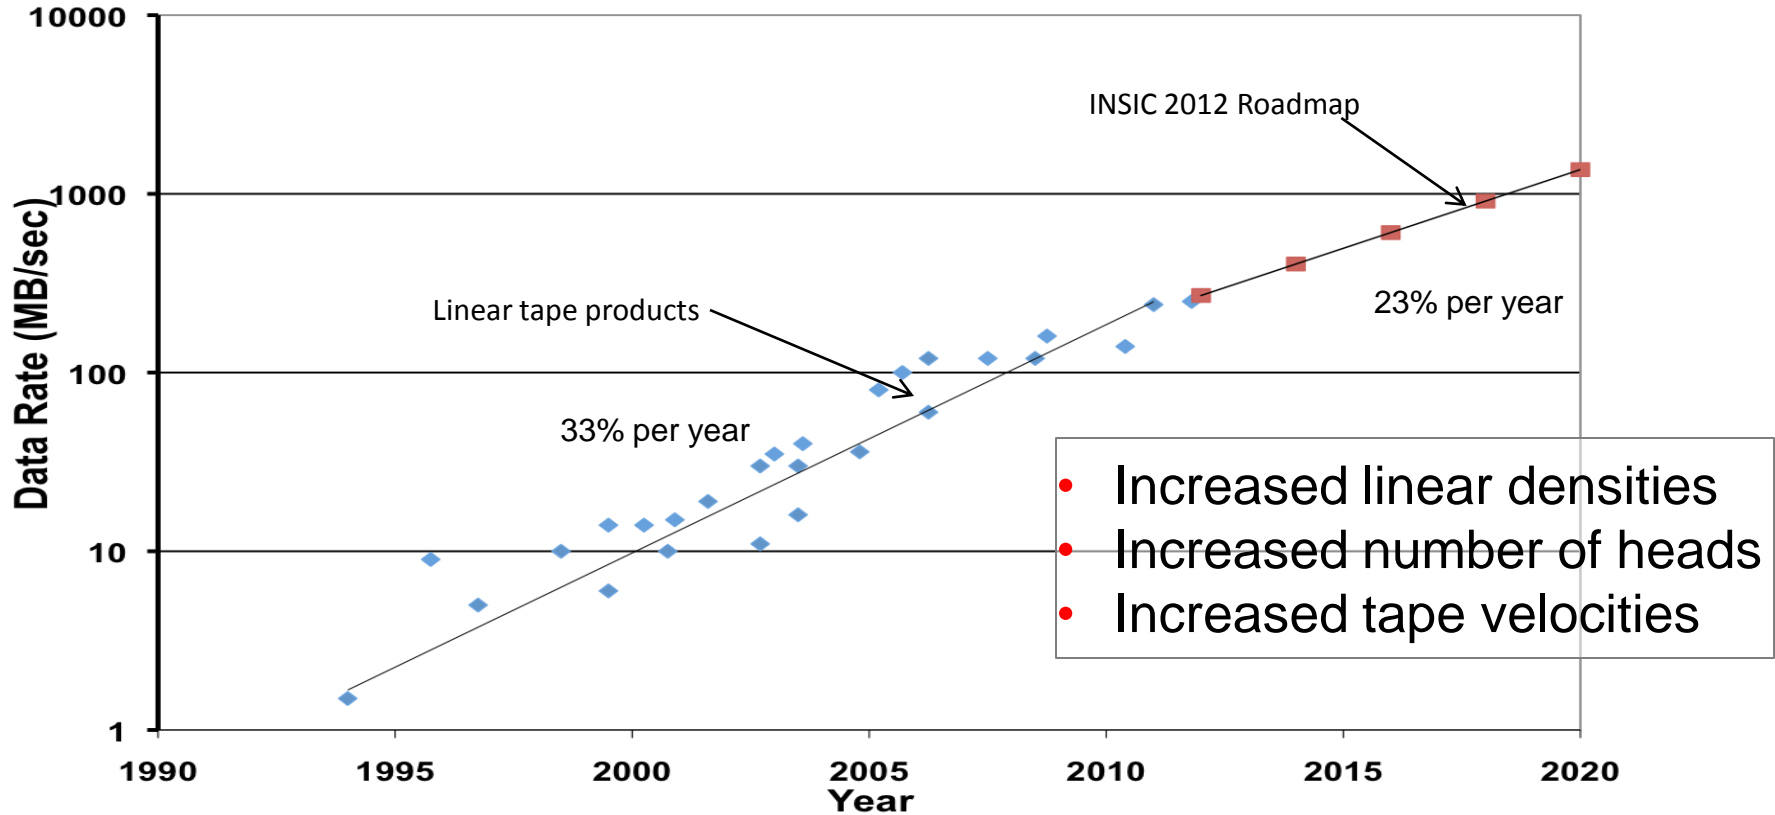

# Tape Areal Density Trends

# Tape Cartridge Capacity Trend

# Tape Data Rate Trend

# Summary

- Truly massive amounts of digital data are being created every year – and the rate of creation is increasing
- Managing / storing this data presents both problems and opportunities
- Magnetic Tape is the ideal large volume / extended period storage solution
  - Magnetic Tape continues to grow in both capacity and data rate
  - Tape has the lowest TCO over (any) other technologies
  - Tape has at least a 30 year archive life
  - New file systems (e.g. LTFS) are making tape much easier to use
